

Abstract

The present invention provides an unmanned dispensing station for laboratory items, for dispensing items only to authorized persons, and to facilitate management objects connected with
5 the operation of the station. Dispensing transaction data is recorded and may be used for further objects.

Further it provides a method for dispensing items only to authorized persons, and to facilitate management objects like scheduling restocking.

A system is also provided comprising at least one up to a plurality of inventive dispensing
10 stations, the system being designed to facilitate the operation of the dispensing stations.
